

Geometry

Pipeline

Determine the position on the image of the camera center

Crop and pad to make symmetric

New FOV of padded symmetric view is $2 \cdot 70.14 = 140.28$ deg

$$vfov = 2 \operatorname{atan}\left[\frac{\text{height} \tan(\text{hfov}/2)}{\text{width}}\right]$$

so

$$vfov \text{ should be } 2 \operatorname{atan}\left(\frac{1636 \tan(140.28/2)}{2862}\right) = 115 \text{ degrees}$$

Note this is different to the quoted value

Left

Right

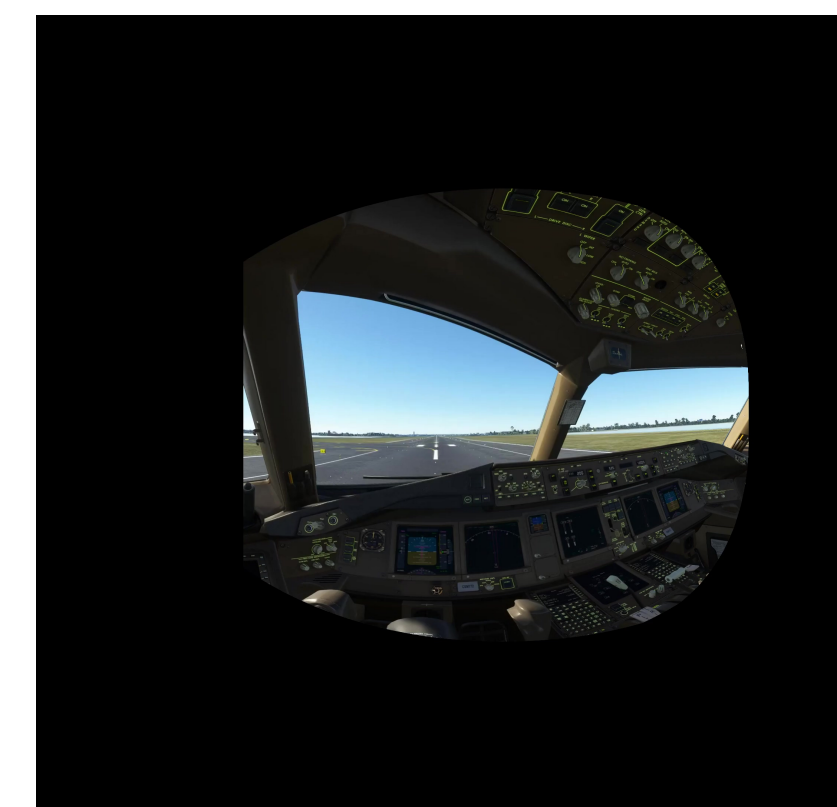

Crop left and right view

Pad to symmetric frustum

Map to half equirectangular including yaw rotation.

Combine to top and bottom frame
